MDMeasure-package Mutual Dependence Measures via Energy Statistics		

Description

MDMeasure: A package for mutual dependence measures via energy statistics

Details

The MDMeasure package provides measures of mutual dependence and tests of mutual independence.

2 mdm

Measuring mutual dependence

The mutual dependence measures include:

- asymmetric measure \mathcal{R}_n based on distance covariance \mathcal{V}_n
- symmetric measure \mathcal{S}_n based on distance covariance \mathcal{V}_n
- complete measure \mathcal{Q}_n based on complete V-statistics
- simplified complete measure \mathcal{Q}_n^{\star} based on incomplete V-statistics
- asymmetric measure \mathcal{J}_n based on complete measure \mathcal{Q}_n
- simplified asymmetric measure \mathcal{J}_n^\star based on simplified complete measure \mathcal{Q}_n^\star
- symmettric measure \mathcal{I}_n based on complete measure \mathcal{Q}_n
- simplified symmetric measure \mathcal{I}_n^\star based on simplified complete measure \mathcal{Q}_n^\star

Testing mutual independence

The mutual independence tests based on the mutual dependence measures are implemented as permutation tests.

mdm

Mutual Dependence Measures

Description

mdm measures mutual dependence of all components in X, where each component contains one variable (univariate) or more variables (multivariate).

Usage

```
mdm(X, dim_comp = NULL, dist_comp = FALSE, type = "comp_simp")
```

Arguments

3	
X	A matrix or data frame, where rows represent samples, and columns represent variables.
dim_comp	The numbers of variables contained by all components in X. If omitted, each component is assumed to contain exactly one variable.
dist_comp	Logical. If TRUE, the distances between all components from all samples in \boldsymbol{X} will be returned.
type	The type of mutual dependence measures, including - asym_dcov: asymmetric measure \mathcal{R}_n based on distance covariance \mathcal{V}_n ; - sym_dcov: symmetric measure \mathcal{S}_n based on distance covariance \mathcal{V}_n ; - comp: complete measure \mathcal{Q}_n based on complete V-statistics;

- comp_simp: simplified complete measure \mathcal{Q}_n^{\star} based on incomplete V-statistics;

- asym_comp: asymmetric measure \mathcal{J}_n based on complete measure \mathcal{Q}_n ;

mdm_test 3

- asym_comp_simp: simplified asymmetric measure \mathcal{J}_n^{\star} based on simplified complete measure \mathcal{Q}_n^{\star} ;
- sym_comp: symmetric measure \mathcal{I}_n based on complete measure \mathcal{Q}_n ;
- sym_comp_simp: simplified symmetric measure \mathcal{I}_n^\star based on simplified complete measure \mathcal{Q}_n^\star .

Value

mdm returns a list including the following components:

stat The value of mutual dependence measure.

dist The distances between all components from all samples.

Examples

```
# X is a 10 x 3 matrix with 10 samples and 3 variables
X <- matrix(rnorm(10 * 3), 10, 3)

# assume X = (X1, X2) where X1 is 1-dim, X2 is 2-dim
mdm(X, dim_comp = c(1, 2), type = asym_dcov)

# assume X = (X1, X2) where X1 is 2-dim, X2 is 1-dim
mdm(X, dim_comp = c(2, 1), type = sym_dcov)

# assume X = (X1, X2, X3) where X1 is 1-dim, X2 is 1-dim, X3 is 1-dim
mdm(X, dim_comp = c(1, 1, 1), type = comp_simp)</pre>
```

 mdm_test

Mutual Independence Tests

Description

mdm_test tests mutual independence of all components in X, where each component contains one variable (univariate) or more variables (multivariate). All tests are implemented as permutation tests.

Usage

```
mdm_test(X, dim_comp = NULL, num_perm = NULL, type = c("comp_simp"))
```

4 mdm_test

Arguments

X A matrix or data frame, where rows represent samples, and columns represent

variables.

component is assumed to contain exactly one variable.

num_perm The number of permutation samples drawn to approximate the asymptotic dis-

tributions of mutual dependence measures. If omitted, an adaptive permutation

size is used.

type The type of mutual dependence measures, including

- asym_dcov: asymmetric measure \mathcal{R}_n based on distance covariance \mathcal{V}_n ;

- sym_dcov: symmetric measure S_n based on distance covariance V_n ;

- comp: complete measure Q_n based on complete V-statistics;

- comp_simp: simplified complete measure \mathcal{Q}_n^{\star} based on incomplete V-statistics;

- asym_comp: asymmetric measure \mathcal{J}_n based on complete measure \mathcal{Q}_n ;

- asym_comp_simp: simplified asymmetric measure \mathcal{J}_n^{\star} based on simplified complete measure \mathcal{Q}_n^{\star} ;

- sym_comp: symmectric measure \mathcal{I}_n based on complete measure \mathcal{Q}_n ;

- sym_comp_simp: simplified symmetric measure \mathcal{I}_n^{\star} based on simplified complete measure \mathcal{Q}_n^{\star} .

Value

mdm_test returns a list including the following components:

stat The value of mutual dependence measure.

pval The p-value of mutual independence test.
